

Package: rformat (via r-universe)

May 14, 2026

Type Package

Title Base R Code Formatter

Version 0.1.0

Description A minimal R code formatter following base R style conventions. Formats R code with consistent spacing, indentation, and structure.

License GPL-3

rformat

*Format R Code***Description**

Format R code string according to base R style conventions.

Usage

```
rformat(code, indent = 4L, line_limit = 80L, wrap = "paren",
        brace_style = "kr", control_braces = FALSE, expand_if = FALSE,
        else_same_line = TRUE, function_space = FALSE, join_else = TRUE)
```

Arguments

code	Character string of R code to format.
indent	Indentation per level: integer for spaces (default 4), or character string for literal indent (e.g., <code>"\t"</code> for vintage R Core style).
line_limit	Maximum line length before wrapping (default 80).
wrap	Continuation style for long function signatures: <code>"paren"</code> (default) aligns to opening parenthesis, <code>"fixed"</code> uses 8-space indent.
brace_style	Brace placement for function definitions: <code>"kr"</code> (default) puts opening brace on same line as <code>{</code> , <code>"allman"</code> puts it on a new line.
control_braces	If TRUE, add braces to bare one-line control flow bodies (e.g., <code>if (x) y</code> becomes <code>if (x) { y }</code>). Default FALSE matches R Core source code where 59% of control flow bodies are bare.
expand_if	Expand inline if-else to multi-line (default FALSE).
else_same_line	If TRUE (default), repair top-level <code>}\nelse</code> (which is a parse error in R) by joining to <code>} else</code> before formatting. When FALSE, unparseable input is returned unchanged with a warning.
function_space	If TRUE, add space before <code>(</code> in function definitions: <code>function (x)</code> instead of <code>function(x)</code> . Default FALSE matches 96% of R Core source code.
join_else	If TRUE (default), move <code>else</code> to the same line as the preceding <code>{</code> : <code>} else {</code> . Matches R Core source code where 70% use same-line else. When FALSE, <code>}\nelse</code> on separate lines is preserved.

Value

Formatted code as a character string.

Examples

```
# Basic formatting: spacing around operators
rformat("x<-1+2")

# Add braces to bare control-flow bodies
rformat("if(x>0) y<-1", control_braces = TRUE)

# Expand inline if-else to multi-line
rformat("x <- if (a) b else c", expand_if = TRUE)

# Wrap long function signatures (default: paren-aligned)
long_sig <- paste0(
  "f <- function(alpha, beta, gamma, delta, ",
  "epsilon, zeta, eta) {\n  1\n}")
cat(rformat(long_sig), sep = "\n")

# Wrap with fixed 8-space continuation indent
cat(rformat(long_sig, wrap = "fixed"), sep = "\n")

# Allman brace style
rformat("f <- function(x) { x }", brace_style = "allman")
```

rformat_dir

Format R Files in Directory

Description

Format all R files in a directory.

Usage

```
rformat_dir(path = ".", recursive = TRUE, dry_run = FALSE, indent = 4L,
            line_limit = 80L, wrap = "paren", brace_style = "kr",
            control_braces = FALSE, expand_if = FALSE, else_same_line = TRUE,
            function_space = FALSE, join_else = TRUE)
```

Arguments

path	Path to directory.
recursive	If TRUE, process subdirectories.
dry_run	If TRUE, report changes without writing.
indent	Indentation per level: integer for spaces (default 4), or character string for literal indent (e.g., "\t" for vintage R Core style).
line_limit	Maximum line length before wrapping (default 80).
wrap	Continuation style for long function signatures: "paren" (default) aligns to opening parenthesis, "fixed" uses 8-space indent.

brace_style	Brace placement for function definitions: "kr" (default) puts opening brace on same line as '{', "allman" puts it on a new line.
control_braces	If TRUE, add braces to bare one-line control flow bodies. Default FALSE matches R Core majority style.
expand_if	Expand inline if-else to multi-line (default FALSE).
else_same_line	If TRUE (default), repair top-level '}\nelse' (which is a parse error in R) by joining to '}' else' before formatting.
function_space	If TRUE, add space before '(' in function definitions: 'function (x)' instead of 'function(x)'. Default FALSE matches 96% of R Core source code.
join_else	If TRUE (default), move 'else' to the same line as the preceding '}'.

Value

Invisibly returns vector of modified file paths.

Examples

```
# Format all R files in a directory (dry run)
d <- tempfile()
dir.create(d)
writeLines("x<-1", file.path(d, "test.R"))
rformat_dir(d, dry_run = TRUE)

# Format and overwrite
rformat_dir(d)
unlink(d, recursive = TRUE)
```

rformat_file

Format R File

Description

Format an R file in place or write to a new file.

Usage

```
rformat_file(path, output = NULL, dry_run = FALSE, indent = 4L,
             line_limit = 80L, wrap = "paren", brace_style = "kr",
             control_braces = FALSE, expand_if = FALSE, else_same_line = TRUE,
             function_space = FALSE, join_else = TRUE)
```

Arguments

path	Path to R file.
output	Optional output path. If NULL, overwrites input file.
dry_run	If TRUE, return formatted code without writing.
indent	Indentation per level: integer for spaces (default 4), or character string for literal indent (e.g., <code>"\t"</code> for vintage R Core style).
line_limit	Maximum line length before wrapping (default 80).
wrap	Continuation style for long function signatures: <code>"paren"</code> (default) aligns to opening parenthesis, <code>"fixed"</code> uses 8-space indent.
brace_style	Brace placement for function definitions: <code>"kr"</code> (default) puts opening brace on same line as <code>{</code> , <code>"allman"</code> puts it on a new line.
control_braces	If TRUE, add braces to bare one-line control flow bodies. Default FALSE matches R Core majority style.
expand_if	Expand inline if-else to multi-line (default FALSE).
else_same_line	If TRUE (default), repair top-level <code>}\nelse</code> (which is a parse error in R) by joining to <code>} else</code> before formatting.
function_space	If TRUE, add space before <code>{</code> in function definitions: <code>function (x)</code> instead of <code>function(x)</code> . Default FALSE matches 96% of R Core source code.
join_else	If TRUE (default), move <code>else</code> to the same line as the preceding <code>{</code> .

Value

Invisibly returns formatted code.

Examples

```
# Format a file (dry run to see result without writing)
f <- tempfile(fileext = ".R")
writeLines("x<-1+2", f)
rformat_file(f, dry_run = TRUE)

# Format and overwrite
rformat_file(f)
readLines(f)
unlink(f)
```
